

GREAT LAKES SMALL CAP OPPORTUNITY FUND

OBJECTIVES

The Small Cap Opportunity Fund seeks to provide total return.

The portfolio consists of securities the manager believes are undervalued in relation to factors such as free cash flow, economic earnings, growth potential or asset value. The investment management process is based on fundamental bottom-up security analysis while using portfolio construction analytics to monitor and manage risk. There is no guarantee that any investment will achieve its objectives, generate positive returns, or avoid losses.

INVESTMENT STRATEGY

The Small Cap team focuses on rigorous fundamental analysis and employs a disciplined valuation approach to select securities for inclusion in its portfolio. A universe of potential investments is initially identified through a series of proprietary screens. After initial analysis, we construct a multi-year free cash flow model for each stock considered for investment to derive an estimate of the stock's fair value. Portfolios are built by owning those stocks with the highest expected rates of return over the investment time horizon, and methodically replacing those in the portfolio having relatively low expected rates of return with well-researched ideas having higher expected rates of return.

We utilize a number of proprietary tools to measure, monitor and manage portfolio risk. We believe that Risk Management begins at the security level, and that our analytical approach may help provide a substantial "margin of safety" that may potentially help in protecting capital during market dislocations.

AVERAGE ANNUALIZED PERFORMANCE

as of 12/31/17

	3 MO	YTD	1 YR	3 YR	5 YR	Since Inception (12/5/2008)
Small Cap Opportunity - Inst.	7.41%	9.52%	9.52%	6.71%	12.42%	16.17%
Small Cap Opportunity - Inv.	7.42%	9.31%	9.31%	6.45%	12.14%	15.87%

Beta is a measure of the systematic risk of a security or portfolio. Beta measures the historical sensitivity of portfolio or security excess returns to movements in the excess return of the market index. The value for Beta is expressed as a percentage of the market where the market Beta is 1.00. A security or portfolio with a Beta above the market has volatility greater than the market. Standard Deviation is a statistical measure of portfolio risk. Standard Deviation is equal to the square root of the Variance. It reflects the average deviation of the observations from their sample mean. In the case of portfolio performance, the Standard Deviation describes the average deviation of the portfolio returns from the mean portfolio return over a certain period of time. Standard Deviation measures how wide this range of returns typically is. The wider the typical range of returns, the higher the Standard Deviation of returns, and the higher the portfolio risk.

MANAGEMENT TEAM

Gary Lenhoff, CFA

Portfolio Manager

Gary Lenhoff joined Great Lakes Advisors in 2010, bringing more than 25 years of industry experience. He began his career as an Investment Analyst with Prudential Investment Company and then served as a Portfolio Manager for Anderson, Hoagland & Co. Then, Gary helped build a team of analysts at Bricoleur Capital Management where he assisted in growing a small cap long/short equity hedge fund from \$450M to over \$1.3B in assets. Most recently, he was CIO of his own firm where he was responsible for all aspects of security selection, portfolio construction, and risk management.

Gary became a Chartered Financial Analyst in 1993 after receiving his B.A. in Economics from the University of Rochester, and his M.B.A. with Distinction from the University of Michigan.

Benjamin Kim, CFA, CPA

Portfolio Manager

Ben Kim joined Great Lakes as Senior Research Analyst in April, 2011. With over 17 years of stock analysis and selection experience in a number of industries, Ben is responsible for equity investments in the Industrial, Technology, and Materials sectors. Prior to joining Great Lakes, Ben was an Investment Analyst at Harris Associates and a Securities Analyst for Skyline Asset Management. Ben holds a BS in Accounting from Indiana University and an MBA with a concentration in Finance and Economics from the University of Chicago. He is a CFA Charterholder and a Certified Public Accountant.

Gary and Ben are supported by Bryan Engler, CFA, Senior Research Analyst for the team.

Investors should carefully consider the investment objectives, risks, charges, and expenses before investing. This and other important information about the Fund is contained in the statutory and summary prospectuses, which can be obtained by calling 855-278-2020 or visiting www.glafunds.com. The prospectus should be read carefully before investing.

Mutual fund investing involves risk. Principal loss is possible. The Fund may invest in non-US Securities which involve greater volatility and political, economic and currency risks and differences in accounting methods. Investments in smaller companies involve additional risks such as limited liquidity and greater volatility.

The benchmark is the Russell 2000 Index (R2000). Russell 2000 returns are taken from www.Russell.com. The Russell 2000 Index measures the performance of the small-cap segment of the U.S. equity universe. The Russell 2000 Index is a subset of the Russell 3000® Index representing approximately 10% of the total market capitalization of that index. It includes approximately 2,000 of the smallest securities based on a combination of their market cap and current index membership. The index is unmanaged and cannot be invested in directly. P/E data excludes non-earning stocks. Price/Earnings Ratio: the Price to Earnings Ratio (P/E) is a measure of value for a company. It is equal to the price of a share of common stock divided by the earnings per share for a twelve-month period. Average Market Capitalization: the product of a security's price & the number of shares outstanding. Price/Book: the ratio of a firm's closing stock price & its fiscal year end book value/share. Return on Equity: the net income divided by total common equity outstanding, expressed as a percent. Price/Earnings to Growth (or PEG) ratio: used to determine the value of company stock while taking into account the earnings growth. The value is calculated by dividing the Price/Forecasted Earnings by the year-over-year forecasted earnings growth rate. Price/Forecasted Earnings: this ratio is a forward-looking valuation measure of a company's common stock. It encapsulates the amount of earnings estimated for next year per dollar of current share price. This value is calculated by dividing the present stock price of each company in the portfolio by the consensus (mean) analysts' earnings forecasts for the next year. These earnings estimates are for recurring, non-extraordinary earnings per primary common share. The individual P/E stock ratios are then weighted by their respective portfolio market values in order to calculate a weighted average representative of the portfolio as a whole. Free Cash Flow: a measure of financial performance calculated as operating cash flow minus capital expenditures. Free cash flow (FCF) represents the cash that a company is able to generate after laying out the money required to maintain or expand its asset base.
